# The CDMS Mobius Importer for DocFinity

Interacting with a Mainframe based Mobius system is becoming more common. In some cases customers want to migrate off Mobius or want to use DocFinity as the processing system for performance and flexibility while still maintaining the long term storage on the mainframe host system.

How does it work?

The CDMS Mobius Importer converts a Mobius image index file into a format that can be imported into the DocFinity system. The CDMS Mobius Importer configuration is flexible and can handle many different variations commonly found in the Mobius import file. The CDMS Mobius Importer runs automatically looking for new files and converting them as they arrive. It creates a backup of the original files and adds the appropriate file extensions to the imported files necessary for DocFinity retrieval.
