

# DocFinity Reports

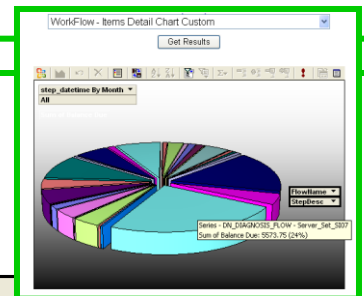

DocFinity Reports allows you to add, modify and delete custom reports to suit your needs. Using DocFinity Reports is very easy and intuitive. In just 10 minutes you can design, build and post to your Intranet a fully functional Data Cube Report for others to use.

DocFinity Reports has been dramatically reengineered and designed to simplify compliance and to give managers greater flexibility. The latest version (released in spring of 2006) is a dynamic tool that allows users to either modify reports that are provided with the module or build their own on the fly. Additionally, DocFinity Reports has been configured with the ability to audit user activity complying with HIPAA and SOX regulations. This module can report on who has accessed documents, as well as the exact times and dates.

DocFinity Reports features two main functions: one for reporting, and another that provides analysis and data mining using graphics and charts. By analyzing the data your company stores within the DocFinity electronic storage system, users can change the report simply by dragging fields that are displayed on the screen. It offers users flexibility, and provides the ability to create highly customizable reports or charts that can be accessed securely over the intranet.

DocFinity Reports aids administrators in proactively monitoring system performance and internal workflow through an easy-to-use Web page. This dynamic module, that works closely with the DocFinity Dashboard module, generates immediate reports, system information and can graphically represent data in unlimited configuration options. DocFinity Reports enables administrators and managers to monitor employees' workflows, streamlining overall system management. DocFinity Reports can monitor and return immediate results on almost any aspect of a Windows environment, giving managers the information that they need to compare data and processes over time.

This functionality provides a quick and easy means to monitor the status of critical system processes including workflow, user, system and database operations. The DocFinity Reports includes pre-built reporting tools that automatically generates reports in real time, simplifying HIPAA and Sarbanes-Oxley reporting. Information is then gathered and presented to administrators in whatever graphical formats they desire.

Workflow - Items Detail Report Custom
